Title: Survey of Prison Inmates, United States, 2016

Alternative Title: Survey of Prison Inmates, 2016

Identification No.: 37692

Responsibility Statement

Authoring Entity: United States. Bureau of Justice Statistics

Series Statement

Series Name: Survey of Prison Inmates (formerly known as the Survey of Inmates in State and Federal Correctional Facilities)

Series Information: Periodically the Bureau of Justice Statistics collects and analyzes data across a variety of topics from a national sample of state and federal prisoners. Data are collected through in-person interviews with prisoners incarcerated in state and federal correctional facilities. The first survey of state prisoners was fielded in 1974 and thereafter in 1979, 1986, 1991, 1997, and 2004. The first survey of federal prisoners was fielded in 1991, along with the survey of state prisoners, and since then both surveys have been conducted at the same time using the same questionnaire and administration. The 2016 administration of the survey was renamed to the Survey of Prison Inmates (SPI). Prior administrations were known as the Survey of Inmates in State and Federal Correctional Facilities (SISFCF).

Abstract

To fulfill part of its mission, the Bureau of Justice Statistics (BJS) conducted the Survey of Prison Inmates (SPI), a national, wide-ranging survey of prisoners age 18 or older who were incarcerated in state or federal correctional facilities within the United States during 2016. SPI provides national statistics on prisoner characteristics across a variety of domains, such as current offense and sentence, incident characteristics, firearm possession and sources, criminal history, demographic and socioeconomic characteristics, family background, drug and alcohol use and treatment, mental and physical health and treatment, and facility programs and rules violations. SPI can also be used to track changes in these characteristics over time, describe special populations of prisoners, and identify policy-relevant changes in the state and federal prison populations. Formerly the Survey of Inmates in State and Federal Correctional Facilities (SISFCF), this survey was renamed SPI with the 2016 administration.

RTI International served as BJS's data collection agent for the 2016 SPI under a cooperative agreement (Award no. 2011-MU-MU-K070). From January through October 2016, data were collected through face-to-face interviews with prisoners using computer-assisted personal interviewing (CAPI). In a CAPI interview, interviewers read questions aloud and enter responses directly into a laptop computer, allowing skip patterns and other routing criteria to be implemented automatically.

Summary Data Description

Time Period: 2016

- Study 37692 -

Date(s) of Collection: January 1, 2016 - October 31, 2016

Country: United States

Geographic Unit: United States

Universe: All male and female prisoners age 18 or older who were held in a state prison or were serving a sentence to federal prison in the U.S. during 2016.

Kind of Data: Survey data

Methodology and Processing

Data Collection Methodology

Time Method: Cross-section

Data Collector: RTI International on behalf of the United States Department of Justice, Bureau of Justice Statistics through a cooperative agreement.

Frequency of Data Collection: Periodic

Additional Methodology

Universe:

The target population for the 2016 SPI was all male and female prisoners age 18 or older who were held in a state prison or were serving a sentence to federal prison in the United States during 2016. The universe of prisons used for the 2016 SPI was based on BJS's 2012 Census of State and Federal Adult Correctional Facilities, which enumerated correctional facilities that held persons sentenced as an adult, including those 17 or younger who were sentenced as an adult. The census included both confinement and community-based facilities, but it excluded special facilities such as those operated by or holding exclusively for the U.S. military, Immigration and Customs Enforcement, the U.S. Marshals Service, and correctional authorities in Indian country.

After the completion of the 2012 census and prior to July 2014, when the SPI sample of prisons was selected, the census was updated to account for known changes in facilities. Supplemental information to update the census was collected from websites maintained by each state's department of corrections and the Federal Bureau of Prisons (BOP). The types of changes included—

- adjusting the population size of a facility to account for a planned change in population
- removing facilities that were planned to close by the time the survey was fielded
- adding new facilities that were known to be operating.

The updated universe consisted of 2,001 unique prisons housing a total of 1,502,671 prisoners, including 1,400,363 male prisoners and 102,308 female prisoners (see Table 1 below).

To make inference to the target population, SPI utilized a two-stage sample design. The first stage consisted of a random sample of prisons. The second-stage consisted of a random sample of prisoners held in the selected prisons.

First-Stage Selection

The sampling frame of prisons, based on the updated 2012 census, was stratified by the sex housed, jurisdiction (state or federal), and self-representing states (i.e., states that housed 100,000 or more prisoners as of December 31, 2013). Facilities which housed both male and female prisoners were split into two sampling units with the male and female component being placed in the appropriate prisoner sex stratum. For state prisons, facilities located in Texas, California, and Florida were each placed in their own stratum, given that those 3 states housed 100,000 or more prisoners as of December 31, 2013.¹ Facilities located in the other 47 states were placed into a single stratum. Based on this stratification, 10 sampling strata were formed. Table 1 presents how the universe (and sample) was allocated across the 10 strata.

¹ While the SPI sample was designed for states housing 100,000 or more prisoners to be self-representing (i.e., Texas, California, and Florida), during the SPI data collection this was not possible for Florida because access to prisoners in restrictive housing was not permitted. See *Estimation Procedures, C. Restrictive housing adjustment* for more information.

^aConsists of 2,001 unique facilities, including 257 co-ed facilities. Co-ed facilities are included in both male and female rows.

^b"Total" and "All other 47 states" include five co-ed facilities in which both male and female portions of the facility were selected. Both male and female rows include these facilities.

^c"Total" and "All other 47 states" include four co-ed facilities in which both male and female portions of the facility were selected. Both male and female rows include these facilities.

The 2016 SPI was designed to collect data in at least 350 facilities². Facilities were selected with probability proportionate to their size measure (PPS). A facility's size measure was based on the number

² The facility (and prisoner) sample size was based on a power analysis that determined the sample size required to produce the same precision or better as was obtained in the 2004 Survey of Inmates in State and Federal Correctional Facilities (SISFCF), or a relative standard error of 10% or less.

of prisoners³ adjusted for two characteristics: (1) whether the sampling unit contained female prisoners and (2) whether the primary function of the facility was to provide mental health services.⁴ The size measure of mental health facilities was increased by a factor of 3 to ensure this subpopulation of prisoners was represented in national estimates. The size measure for the female portions of facilities was increased by a factor of 3.5 in state facilities and 2.4 in federal facilities to ensure that enough females were sampled to generate reliable national estimates for this subpopulation. The allocation of 340 facilities was based proportionally on the total size measure for a stratum. The remaining 10 facilities were proportionately allocated across the federal stratum as a set-aside from oversampling federal prisons to ensure precision goals for federal estimates.

The initial facility sample allocation was adjusted for anticipated non-participation using two methods. First, the desired sample of 350 facilities was inflated for an anticipated 85% first-stage cooperation rate. Second, the sample size was increased to incorporate a reserve sample. The reserve sample consisted of 50 additional facilities allocated to the state facility strata (male and female) consisting of facilities in all other 47 states, excluding Texas, California, and Florida. The reserve sample was to be released only if the facility cooperation rate fell below 85%. This led to an initial first-stage sample size of 465 facilities.

Within each stratum (h), the expected likelihood of selection (e_i) was calculated for each facility. This was done using the formula—

$$e_i = \frac{m_h S_i}{S_{h+}}$$

where m_h is the number of responding facilities in stratum h , S_i is the size measure for facility i and S_{h+} is the aggregate size measure for stratum h . All facilities in which $e_i > 1$ were identified and selected with certainty. After adjusting the sample size within each stratum to account for the certainty sample, the remaining sample was selected PPS.

Because of the uncertainty around the first-stage cooperation rate, an initial random replicate of 355 facilities was released to the field for data collection. During the first half of data collection, it was determined, based on projected refusal and eligibility rates calculated, that a second random replicate of 30 facilities was necessary to release to ensure that the target number of facilities and interviews could be obtained. With the second random replicate, the total facility sample size of 385 facilities was projected to be sufficient to achieve the target of 350 participating facilities.

Because the replicates were selected with equal probability, the first-stage probability of selection (π_1) for each non-self-representing facility within stratum h was—

$$\pi_1 = \frac{m_h S_i}{S_{h+}}$$

The probability of selection for each self-representing facility was 1 (i.e., $\pi_1 = 1$).

³ Prisoner counts were for the specific sex stratum.

⁴ Facilities whose primary function was mental health services were identified on the 2012 Census of State and Federal Adult Correctional Facilities.

For more information on the design of the 2016 SPI sample, see *Methodology: Survey of Prison Inmates, 2016* (NCJ 252210, BJS web, July 2019).

Second-Stage Selection

For state prisons, within each stratum, SPI was an approximate equal probability selection method (EPSEM) design. That means that if a constant number of prisoners per facility was selected and nonresponse was constant across facilities, the design would be self-weighting giving each respondent within a stratum (regardless of facility size) the same probability of selection, and therefore the same analysis weight. This type of design minimizes the variance of national estimates, which was a primary goal of the 2016 SPI.

Within each state facility, the target respondent sample size was 64 prisoners. Using an assumed 70% response rate, 92 prisoners were selected from each state facility. To minimize burden on smaller prisons, when 92 prisoners exceeded 75% of the population in a facility, the sample size was set to 75% of the facility's total population. If a facility housed male and female prisoners and both portions of the facility were selected, then two separate samples of 92 prisoners were selected within that facility—one for each sex.

The prisoner sample in state prisons was selected using a simple random sample method. A roster of current prisoners was obtained from sampled facilities no more than one week prior to the scheduled start of interviewing. The roster collected prisoners' biometric identifier, facility inmate ID, name, sex, date of birth (or age), and housing unit assignment, as well as other inmate characteristics to be used for nonresponse bias analysis—race, Hispanicity, date of prison admission, and sentence length. Prior to sample selection, ineligible prisoners were removed from the roster. Ineligible prisoners consisted of persons younger than 18 years of age and persons who did not have an assigned bed at the facility the night before the roster was generated. After ineligible prisoners were removed, a random sample of prisoners was selected.

Based on this design, in a state facility with N eligible prisoners, the probability of selection was defined as—

$$\pi_2 = \frac{n}{N}$$

where n is the sample size for the facility—the minimum of 92 and 75% of the facility population.

For federal prisons, a stratified sample of prisoners was selected based on whether a prisoner's controlling offense was a drug offense or a non-drug offense within each facility. Given that half of all federal prisoners were serving a sentence for a drug offense⁵, prisoners in the non-drug offense stratum were oversampled by a factor of 1.5⁶ to ensure a large enough sample was selected to produce valid

⁵ *Prisoners in 2016* (NCJ247282, BJS web, September 2014), which was the most recent report on prisoners at the time the SPI sample was designed.

⁶ To illustrate the oversample, if a facility held 500 prisoners – 400 drug offenders (80%) and 100 non-drug offenders (20%) – then the sample size for non-drug offenders would be set at $115 \times 0.2 \times 1.5 = 35$ and the sample size for drug offenders would be set at $115 - 35 = 80$.

estimates of this subpopulation. A total of 80 respondents was targeted in each federal facility. Assuming a 70% response rate, the sample size was set at 115 prisoners in each federal prison. Similar to state prisons, if a sample of 115 prisoners exceeded 75% of the population in a federal facility, then the sample size was set to 75% of the facility's total population.

The federal sample of prisoners was selected using a stratified simple random sample method. Similar to state prisons, a roster of current prisoners was obtained from sampled facilities no more than one week prior to the scheduled start of interviewing. Prior to sample selection, ineligible prisoners were removed from the roster. Similar to state prisons, ineligible federal prisoners consisted of persons younger than 18 years of age and persons who did not have an assigned bed at the facility the night before the roster was generated. After ineligible prisoners were removed and the sample size for each stratum (drug and non-drug) was determined, a random sample of federal prisoners was selected within each stratum.

Based on this design, in a federal facility with N_h eligible prisoners in stratum h , where h =drug and non-drug offenders, the probability of selection within each stratum was defined as—

$$\pi_2 = \frac{n_h}{N_h}$$

where n_h is the sample size allocated to stratum h .

Response Rates and Completed Interviews

The 2016 SPI collected data in 364 facilities out of the 385 that were sampled. Of the 21 non-participating facilities (12 state and 3 federal), 15 were determined to be ineligible and 6 refused to participate. The first-stage response rate was 98.4%: 98.1% among state prisons and 100% among federal prisons (see Table 2).

^a Total includes 6,934 state and federal prisoners who refused to participate and 2,376 who the facility would not permit to be interviewed.									
^b Includes prisoners who were unable to be interviewed for various reasons, including those who left the facility after data collection began; were in restrictive housing for non-medical reasons; stopped the interview shortly after it started; were off facility grounds/at another facility; were in the hospital/medical ward; did not speak English or Spanish; or were unavailable because of work assignments, participation in programs, or other reasons.									

A total of 24,848 prisoners participated (20,064 state and 4,784 federal prisoners) in the 2016 SPI, based on a sample of 37,058 prisoners (30,348 state and 6,710 federal). The second-stage response rate (the response rate among selected prisoners) was 70.0%: 69.3% among state prisoners and 72.8% among federal prisoners.

The 10,661 sampled prisoners who were eligible for the survey but did not participate included 6,934 prisoners who refused to participate, 2,376 who the facility would not permit to be interviewed, and 1,351 who were unable to participate for other reasons. Refusals by facilities included prisoners who were deemed by the facility to be a safety or security risk because they were too violent to be interviewed. This group also included prisoners to whom SPI interviewers were not permitted access because they were not housed in the general population. The majority of these were from one state. Another 1,549 sampled prisoners were deemed ineligible for the survey because they had left the facility prior to data collection (1,114) or could not complete the interview because they were mentally incapable (339), physically unable (93), or ineligible for other reasons (3).

Sampling Frame Changes

There are differences between how privately operated correctional facilities were classified in the 2004 Survey of Inmates in State and Federal Correctional Facilities (SISFCF) and the 2016 SPI sampling frames. In the 2016 SPI, private confinement correctional facilities that were operated exclusively for the Federal Bureau of Prisons (BOP) were assigned to the federal sampling frame (15). All other privately operated correctional facilities were assigned to the state sampling frame. In the 2004 SISFCF, private correctional facilities that were holding exclusively for the BOP (19), including confinement and community-based

facilities, were classified as out of scope for the study, which means those types of facilities were excluded from both the SISFCF federal and state frames.

Furthermore, the 2012 Census of State and Federal Adult Correctional Facilities, which was used as the basis for the 2016 SPI frame, did not collect information needed to determine the proportion of inmates held for various authorities in other correctional facilities, including other privately operated correctional facilities. Therefore, for private facilities that did not exclusively hold federal prisoners for the BOP, it was not possible to determine whether 50% or more of the one-day count (ODC) of prisoners was held for the BOP, and thereby would be included on the federal frame, or was held for states, and thereby would be included on the state frame. In the 2004 SISFCF, it was possible to determine if facilities met the 50% threshold because the 2000 Census of State and Federal Adult Correctional Facilities, which was used as the basis for the 2004 SISFCF sampling frame, collected that information. Since that information was available for the 2004 SISFCF, it was possible to differentiate between 1) private facilities with an ODC that was more than 50% of federal prisoners held for the BOP (7), which were excluded from the SISFCF frame altogether, and 2) private facilities with an ODC that was more than 50% of prisoners held for states, which were included on the SISFCF state sampling frame. Given the limited information for the 2016 SPI though, both types of facilities were included on the state frame.

Users should be aware of these differences related to the classification of privately operated correctional facilities on the federal sampling frames between the 2004 SISFCF and the 2016 SPI, and proceed with caution when making particular comparisons between the two studies. For example, analyses conducted by BJS revealed that the change in the percentage of non-U.S. citizens in federal prisons between 2004 (16.2%) and 2016 (24.9%) was not significantly different due to a relatively large standard error (5.35%) for the 2016 estimate. Upon further investigation, it was discovered that clustering of non-U.S. citizens within a few privately operated correctional facilities that were holding inmates exclusively for the BOP in 2016 led to a relatively large intracluster correlation, which increased the variance of the 2016 estimate. In addition, as previously explained, the 2004 SISFCF excluded privately operated correctional facilities holding inmates exclusively for the BOP. This may have contributed to an underestimate of non-U.S. citizens in federal prisons from the 2004 SISFCF, especially when compared to an estimate based on data that the BOP reported to BJS through its Federal Justice Statistics Reporting Program in 2004 (27.5%). The 2016 SPI estimate of non-U.S. citizens in federal prisons is fairly consistent with an estimate based on data that the BOP reported to BJS through its Federal Justice Statistics Program in 2016 (21.4%).

Description of Interviews:

SPI interviews averaged approximately 50 minutes, including about 2 minutes for the consent process and 48 minutes to complete the survey. Interviews were conducted in English (94%) and Spanish (6%).

As with prior iterations of the SPI, before the interview prisoners were informed verbally and in writing that their participation was voluntary and that all information provided would be held in confidence. The 2016 SPI was the first time BJS sought to link prisoners' self-reported data with their administrative records maintained by other government agencies. Therefore, it was the first time BJS requested consent from prisoners to do such linking, involving criminal history, employment, income, and beneficiary records from participation in government programs. It was explained to prisoners that linkage to the record sources would take place for up to 5 years after data collection was completed.

- Study 37692 -

The request for record linkage was combined with the survey request, and together these requests were administered to prisoners through a single informed consent protocol.

Full-study participation in the 2016 SPI consisted of consent provided by prisoners to participate in the survey and all data linkage for the record sources described for up to 5 years after data collection. Prisoners who initially refused or expressed concerns about full-study participation were able to opt out of the full-study request in favor of partial-study participation. Partial-study participation consisted of consent provided by prisoners to participate in the survey and to linking their self-reported data to their existing criminal records only to supplement the data collected through the 2016 SPI. Prisoners who consented to partial-study participation did not provide consent to link their self-reported SPI data to any other record sources or their future (i.e., up to 5 years after data collection) criminal-history records.

Mode of Data Collection: Computer-assisted personal interview (CAPI)

Data Processing and Editing:

CAPI System Errors

Some CAPI system errors in the 2016 SPI affected either how data from respondents for some questions were collected or how some questions were presented to respondents. Three different types of CAPI system errors that resulted are described below: 1) programming errors, 2) specification errors, and 3) administration errors. Table 3 presents all three types along with the variables and question items affected.

Programming errors discovered during and after data collection caused some questions to be inappropriately skipped during interviewing which resulted in missing data for those items. It was determined to be difficult to recode the affected cases with imputed values based on the limited information available. For the variables affected, the cases impacted by this type of error appear in the data file and codebook with a code and value label of “-9 = Response missing response due to CAPI issue” so users are aware of the impact of the programming error. The codebook includes a note for the affected variables, and the 2016 SPI questionnaire includes footnotes that flag the particular questions associated with the variables that are affected by a programming error.

During data processing, a few specification errors were discovered that permitted subsequent questions to be asked or skipped during interviewing that were not consistent with previous responses reported by respondents. It is possible for users to recode the affected cases based on responses to previous questions, so the responses to the questions with a specification error are consistent with how the instrument should have performed. The codebook includes a note for the affected variable, and the 2016 SPI questionnaire includes footnotes that flag the particular questions associated with the variables that are affected by a specification error. Each footnote includes information so users are aware of the impact of the specification error, and a possible recode to correct for it.

During data collection, two administration errors were discovered that resulted in the instrument failing to insert an appropriate question fill based on previous responses reported by respondents or the preferred interview language. The codebook includes a note for the affected variables, and the 2016 SPI questionnaire includes footnotes that flag the particular questions associated with the variables that are affected by an administration error.

CAPI Variables

Some variables on the data file include “(CAPI variable)” in the variable label to indicate that the CAPI instrument created the variable, as opposed to the variable reflecting specific responses from questions that were asked of prisoners. There are three main types of CAPI variables included on the data file: 1) those created about the administration of the survey, 2) those created to route prisoners through the survey, and 3) those created through post-collection data processing to code offense literals.

The first set of CAPI variables contain unique information regarding the administration of the SPI survey, such as the type of consent obtained (V0005) or the language in which the interview was conducted (V1555). The second set of CAPI variables may appear to overlap with questions asked of prisoners, such as questions about dates or specific offenses. In some of these situations, the CAPI instrument used the prisoners’ responses to classify them and stored that information in those variables (i.e., CAPI variables) to appropriately route prisoners through the survey. For example, if a prisoner reported that s/he was sentenced for simple assault and drug trafficking, and the CAPI instrument determined that drug trafficking was the prisoner’s most serious offense (based on the offense with the longest sentence), then the CAPI instrument created a stored variable in real time during the interview, that indicated the prisoner was a drug offender. Only prisoners who were classified by the CAPI instrument as violent offenders (based on their most serious offense) were asked SPI questions on victims, so before starting the SPI section on victims, the CAPI instrument queried the stored CAPI variable to determine whether the prisoner was classified as a violent offender. In the example used here, the CAPI instrument would determine the prisoner was not a violent offender, and would route the prisoner past the victims’ questions to the next section of the SPI survey.

In situations like this, where a CAPI variable was used for instrument routing, the variable label will include “Incident Section Routing.” The data in these CAPI routing variables may not necessarily be consistent with variables that should be used for analysis, such as offense variables coded using BJS’s standard 3-digit offense codes (see Appendix A and *Offense CAPI Variables*), or recoded variables that were created by BJS. During post-collection data processing, some responses from prisoners, such as literal responses to questions on specific offenses, were coded differently in the 3-digit coded offense variables or recoded variables than how the CAPI instrument coded them in real time (during the

interview) for the purposes of instrument routing. Therefore, the values of the stored CAPI routing variables may not necessarily match the distributions of the final analysis variables.

The third set of CAPI variables are those that were created through post-collection data processing to code the offense literals reported by prisoners, as mentioned above. See *Offense CAPI Variables* for more information.

Offense CAPI Variables

Data on specific offenses were collected through different series of questions in the SPI survey depending on why prisoners were incarcerated (e.g., committed a new crime, violated probation, violated parole, etc.), and thereby routed through the survey by the CAPI instrument. To minimize disclosure risk, the literal responses to questions about specific offenses were suppressed from the data file. BJS assigned each literal response a specific, standardized offense code, using BJS's standard offense codes that appear in Appendix A. These coded offense variables are the ones that appear on the data file. While "(CAPI variable)" is included in their variable label, they are also designated as "NCRP3" and "3-digit NCRP Code" in the variable label. (NCRP is BJS's National Corrections Reporting Program which also uses BJS's standardized offense codes in Appendix A to classify offenses.) The data file also includes recoded offense variables created by BJS for analysis and reporting of BJS statistics. See *Recoded Variables* for more information.

Open-Ended Responses and Items Flag Variables

The 2016 SPI included survey questions with open-end responses, typically appearing on the survey as "other" options, where interviewers entered the responses reported by the prisoners verbatim into the CAPI instrument. Respondents were also asked a number of questions that permitted more than one potential response option, with some of these including an open-ended response option. When possible during data processing, open-ended responses were upcoded into existing question response options. A new set of variables with "Upcoded" appended to their variable label was created reflecting the upcoding, and "Original" was appended to the variable label of the variables without any upcoded open-ended responses. For many cases, the upcoded variable versions will have the same response value(s) as the original variables. However, in a subset of cases, using the information reported by the respondents in the open-ended items, some cases were recoded from the original response option to provide more accurate information.

As an example, question CJH4, "What [FIREARM_FILL]? Check all that apply." is a multiple-choice question including several firearms and "some other type of firearm" as a response option. The "some other type of firearm" response routed respondents to the open-ended question CJG4_OTH, "What other type of firearm?" Upon review, some of these "some other type of firearm" responses were consistent with one of the defined response options included in the questionnaire (e.g. handgun, rifle, shotgun, etc.). In these cases, the open-ended response was upcoded to the relevant category. For example, a respondent might have indicated that "some other type of firearm" was involved, but then in their open-ended response they specified ".357 caliber" which is a handgun. This response would then be upcoded from "some other type of firearm" to "handgun". Similarly, if a respondent specified "no firearm" as their "some other type of firearm" response, the response would be upcoded to a missing value.

For all multi-response questions in the 2016 SPI, an “Item Flag” variable (one for the “original” version, and one for the “upcoded” version) is included in the data file to inform users of the variables, and the number of cases, affected by this type of situation. These “Item Flag” variables provide distributions of the valid and invalid responses encompassed in the multi-response question variables; the “Item Flag: Original” variable indicates the original response distribution, whereas the “Item Flag: Upcoded version” variable indicates the upcoded response distribution. Specific codes and value labels are provided so users have the information to make a decision about how to treat these cases for analysis. The codes and value labels for these cases were applied as follows in Table 4—

Table 4. Item Flag Variables: Values, Definitions, and use in “Original” vs. “Upcoded” Item Flags

Item Flag Value Label	Value Label Definition	Original Item Flag	Upcoded Item Flag
0 = Not answered due to question skip	Respondent was not asked this question due to the skip pattern (question did not apply to the respondent).	X	X
1 = Contained at least one valid response entry	Respondent selected at least one of the multi-response question categories, e.g., in the example question above, the respondent selected one of the specified firearm types or the “some other type of firearm” option.	X	X
2 = Missing in-universe	The respondent was or should have been asked the question, but did not provide a valid response. This value is conceptually similar to the “missing” value in other variables, but is specific to the “item flag” variables.	X	X
3 = Recoded: missing in-universe	This value indicates that the upcoding of this variable resulted in changing what was initially determined to be a valid response to a “missing in-universe” response. Essentially, these are responses that were coded as “other” in the “Original” variable, but upon examination of the corresponding open-ended response, were determined to actually be invalid or missing. These cases were recoded so they are correctly specified as missing, but they are given a “recoded: missing in-universe” value instead of “missing in-universe” so that the analyst can easily identify these upcoded cases and decide how to handle them in their analysis.		X
7 = Contained a don’t know response	This value is similar to other variables, in that it indicates the respondent was asked the question and provided a “don’t know” response.	X	X
8 = Refusal	This value is similar to other variables, in that it indicates the respondent was asked the question but refused to provide a response.	X	X
-9 = Response missing due to CAPI issue	This value indicates that the respondent was not asked the question when they should have been, due to a programming error in the CAPI instrument.	X	X

Users should be aware that if an “other” response was upcoded to a specified response option, then there would be no change between the original and upcoded “item flags”, as the respondent would be coded as a “1” in both instances.

Recoded Variables

Recoded variables appear in the data file with “RV” included in their variable name to differentiate them from the original survey variables, which include “V” in their variable name. These “RV” variables are coded or constructed variables created by BJS for the purposes of BJS analysis and reporting. A number of these variables are temporarily suppressed in the data file because BJS has not yet completed their analysis and official reporting of the estimates. Once BJS releases the estimates from the remaining recoded variables, they will be appended to the data file.

The code for the recoded variables that are currently on the data file has been included in a separate file as supporting documentation. The code is primarily provided as a reference for users to understand how these recoded variables were specified by BJS and reported on in BJS products resulting from the 2016 SPI.

Imputation

Item nonresponse occurs when a respondent chooses not to answer a question or the respondent is not asked a question they should be. Depending on the level and cause of the item nonresponse, imputation can be used to fill in the missing values. However, because imputation is imperfect (i.e., it cannot be known for sure if the imputed value is the true response), and, therefore, adds noise to the estimates, it should be used sparingly.

After data collection was completed, and before the weights were created, two variables used for nonresponse and post-stratification adjustments were imputed to be complete. For the 2016 SPI, sex, age, and geographic jurisdiction⁷ (i.e., Texas, California, other remaining states, and federal) were used to benchmark the 2016 survey. Of these attributes, sex and age were collected through the SPI questionnaire. Self-report sex was missing for 152 survey respondents and self-report age was missing for only one survey respondent. For these cases, sex and date of birth provided through the facility rosters (for sampling purposes) were used to conduct logical imputation.

In the 2016 SPI, some CAPI system errors were discovered during and after the data collection period. Some of these errors were corrected during data collection. However, all interviews conducted prior to discovery or correction of the CAPI system errors have missing responses for questions that were impacted. After reviewing the data, distributions, and simulating on prior rounds of SPI data where the routing errors had not occurred, imputation was not conducted. See *CAPI System Errors* for more information on how these CAPI errors are flagged and coded in the SPI data file.

Estimation Procedures:

The estimation procedures for the 2016 SPI involved weighting the responses from the interviewed prisoners to produce national estimates, including separate estimates for state and federal prisoners, and some subnational estimates (for the self-representing states of Texas and California) with some

⁷ The administrative data collected through the facility rosters were used to provide geographic location for weight adjustments since that was not collected through the SPI questionnaire.

calculable degree of sampling error. A series of adjustment factors was applied to the design-based weights of each interviewed prisoner. Weights for state and federal prisoners were calculated separately.

Bias could result if the non-respondents were different from the respondents (nonresponse bias) or if the sampling population (the frame) did not accurately represent the target population (coverage bias). To compensate for these two possibilities, nonresponse and post-stratification adjustments were made.

Design-Base Weights

The initial weight or design-based weight was produced for each stage of sampling.

1. First-Stage

The design-based weight for the first-stage (w_1) was the inverse probability of selection of a facility. This is equal to—

$$w_1 = \frac{1}{\pi_1}$$

2. Second-Stage

The design-based weight for the second-stage (w_2) was the inverse probability of selection of a prisoner. This is equal to—

$$w_2 = \frac{1}{\pi_2}$$

Eligibility Adjustment

While the first-stage and second-stage frames were cleaned prior to drawing a sample, some ineligible sampling units were not identified until after data collection began. To adjust for this coverage error, an adjustment factor was produced at each stage of selection.

1. First-Stage

In the first-stage of selection to correct for selecting ineligible facilities, an adjustment was computed as—

$$ADJ_{IN-1} = I(ELIG1)$$

Where $I(ELIG - 1)$ is an indicator of a facility's eligibility status such that $I(ELIG1)$ equals 1 if the facility is eligible and equals 0 if the facility is ineligible.

2. Second-Stage

In the second-stage of selection to correct for selecting ineligible prisoners, an adjustment was computed as—

$$ADJ_{IN-2} = I(ELIG2)$$

Where $I(ELIG - 2)$ is an indicator of a prisoner's eligibility status such that $I(ELIG2)$ equals 1 if the prisoner is eligible and equals 0 if the prisoner is ineligible.

Restrictive Housing Adjustment

In some states, most notably Florida, departments of corrections (DOC) restricted the second-stage sampling population to exclude prisoners held in restrictive housing⁸. In these cases, facility rosters obtained for the purposes of sampling did not provide any information on the restrictive housing population. Because there was no information provided about these prisoners, an alternative adjustment was produced prior to the nonresponse adjustment.

Prisoners held in restrictive housing were included in the 2016 SPI target population and, therefore, were sampled and interviewed in facilities which allowed them to be. In facilities that did not permit such interviews, restrictive housing prisoners could not participate and were identified with a specific disposition code identifying them as held in restrictive housing.⁹

Because prisoners held in restrictive housing were likely different from prisoners who were not on many of the key measures estimated in the 2016 SPI, the weights for prisoners held in restrictive housing who were permitted to be sampled but refused to participate were increased to account for prisoners in restrictive housing who were not permitted to be sampled for interviewing, as the latter were also non-respondents. Therefore, the restrictive housing adjustment was defined as—

$$ADJ_{AS} = \frac{\sum w_2 I(AS)}{\sum w_2 I(AS) I(AS - P)}$$

where $I(AS)$ is an indicator variable for all restrictive housing prisoners and $I(AS - P)$ is an indicator variable for restrictive housing prisoners within facilities which allowed prisoners in restrictive housing to be sampled and interviewed.

Due to the large number of prisoners held in restrictive housing in Florida that were not permitted to be sampled for interviewing, and for whom no information was provided, state-specific weights could not be produced. However, after incorporating this restrictive housing adjustment described here, Florida respondents were accounted for to produce national estimates.

Nonresponse adjustment

Within each stage of selection, a separate nonresponse adjustment was produced.

1. First-stage

Among facilities, the survey weights were adjusted to account for facility nonresponse through a ratio adjustment within each stratum. The adjustment (ADJ_{NR}) was computed as—

⁸A unit of a correctional facility where prisoners are separated from the general prison population for various reasons, including for protective custody; for classification, reclassification, or transfer to another facility or unit within a facility; as a sanction for violating a facility rule; to provide for special needs (e.g., medical or mental health); or to ensure the safety, security, or orderly operation of the facility. Restrictive housing typically involves limited interaction with other inmates, and other restrictions. See *Use of Restrictive Housing in U.S. Prisons and Jails, 2011-12* (NCJ 249209, BJS web, October 2015) for more information

⁹ Restrictive housing status was not asked on the 2016 SPI survey. Therefore, only nonresponding prisoners in restrictive housing could be identified for this adjustment.

- Study 37692 -

$$ADJ_{NR1} = \frac{\sum_h w_1 I(R)}{\sum_h w_1}$$

where $I(R)$ is an indicator of response where $I(R) = 1$ for respondents and $I(R) = 0$ for nonrespondents.

2. Second-Stage

To adjust for prisoner nonresponse at the second stage of selection, a generalized exponential model (GEM; Folsom and Singh 2000) using SUDAAN's WTADJUST procedure was used. The GEM procedure was computed at the sex and jurisdiction level. For state facilities, jurisdiction was defined as the individual state. All federal facilities comprised a single jurisdiction. Computing the second-stage nonresponse adjustment at the jurisdiction level was done for two reasons: (1) to increase the number of sampling units which contribute to the model and allow for a more robust set of covariates, and (2) to account for an inconsistent set of covariates provided by each DOC which provided the sampling rosters for all facilities within a jurisdiction, or for the use of differing definitions of the roster elements provided. For example, some DOCs could not provide an indicator of Hispanicity. In addition, some DOCs provided the maximum sentence length while others provided an expected exit date. When an expected exit date was provided, the sentence length was computed by subtracting the prison admission date provided, but the resulting sentence length may not equal the maximum sentence length.

GEM is a calibration model which ensures weight totals are maintained for each level of the model (i.e., all main effects and interactions). Within each state, a model with a second-stage response indicator as the dependent variable was fit with the following characteristics—

- Age category (18-21, 22-25, 26-30, 31-35, 36-40, 41 or older)
- Race/ethnicity (White, Black, Hispanic, Native American, Asian, Pacific Islander, Other)
- Time served since admission (less than 1 month, 1-6 months, 6 months- 1 year, 1-5 years, 5-10 years, 10 or more years)
- Sentence length (less than 6 months, 6 months – 1 year, 1-5 years, 5-10 years, 10-20 years, 20 or more years)
- Offense type (federal prisoners only) (non-drug offense or drug offense)
- Interactions (all two-way interactions)

For states with smaller sample sizes of prisoners, the model was reduced to ensure convergence. For each responding prisoner, based on their characteristics, a model-based adjustment factor ADJ_{NR2} was produced.

Post-Stratification Adjustment

A final post-stratification adjustment was conducted to ensure the analysis weights represented the target population. The survey weights were benchmarked to the prisoner population as of December 31, 2015 as determined by BJS's National Prisoner Statistics (NPS). NPS counts were provided by jurisdiction and sex where jurisdiction included the following levels—

- California
- Texas
- All states other than California or Texas

- Federal (Bureau of Prisons)

Benchmarking was further conducted by age category. Because NPS does not collect counts by age category, the distributions by age category by sex and jurisdiction were obtained from BJS's National Corrections Reporting Program for state jurisdictions and the Federal Justice Statistics Program for the federal jurisdiction. The population control totals used in the 2016 SPI are detailed in Table 5.

Table 5. Population Control Totals by Post-Stratification Stratum

Jurisdiction	Male	Female
California	122,374	5,441
Texas	139,446	12,998
All other states	897,316	70,736
Federal	162,683	10,730

Within each resulting post-stratification stratum, the post-stratification adjustment was defined as—

$$ADJ_{PS} = \frac{N_{PS}}{\sum_{PS} w_{NR}}$$

where N_{PS} is the control total for post-stratification stratum PS and w_{NR} is the adjusted weight through the nonresponse adjustment (i.e., $w_{NR} = w_1 \times ADJ_{IN1} \times ADJ_{NR1} \times w_2 \times ADJ_{IN2} \times ADJ_{AS} \times ADJ_{NR2}$).

Final Weight

The final weight for each responding prisoner (w_F) is the product of the two design-based weights times each adjustment factor. The final weight is defined as—

$$w_F = w_{NR} \times ADJ_{PS}$$

Methods for Computing Standard Errors:

Taylor Series Linearization

One method of estimating standard errors is through Taylor Series Linearization (TSL) which is a computational procedure that uses the sampling design, including strata and clusters, to estimate standard errors. For clustered designs, standard errors are estimated from the standard error among clusters; for stratified designs, standard errors are estimated within each stratum. Estimates of standard errors of means are available through formula and more complex estimates are then functions of means, so that derivatives are used to linearize the variance. More information about Taylor series variance estimation for sample survey data is found in Woodruff (1971), Fuller (1975), Lohr (2009), Särndal, Swensson, and Wretman (1992), Lee, Forthoffer, and Lorimor (1989), and Wolter (1985).

To calculate the TSL standard errors for the SPI or any survey, the analyst needs the stratum identifiers, cluster identifiers, and analysis weights. The stratum and cluster identifiers for the 2016 SPI are available on the restricted-use file only. Additionally, software packages with complex survey analysis are

required; for example, SAS, R, SPSS, Stata, and SUDAAN. See the 2016 SPI User's Guide for additional information and sample code.

Replicate Weights

Replicate weights are used for disclosure risk avoidance and can be analyzed without specific knowledge of the complex sampling design. SPI replicate weights were constructed using the Jackknife-n method. All the methods for constructing replicate weights involve a general process for their production and the estimation of proper variances. This process includes the following steps—

1. The sample is broken into subsamples, called replicates.
2. Each replicate has a weight adjustment performed to account for unit nonresponse and coverage error, such as nonresponse and/or calibration.
3. Estimates are made for each replicate as well as for the full sample.
4. The differences between the estimates from the full sample and each replicate are used to calculate the variance of the estimate.

The SPI data file includes replicate weights. The standard error using Jackknife weights can be calculated in many statistical software packages including SAS, R, Stata, and SUDAAN. See the 2016 SPI User's Guide for additional information and sample code.

Data Files Description

File-by-File Description

File Name: Public-use U.S. Data (state and federal combined)

Contents of Files: The file contains responses from interviews with prisoners in state and federal correctional facilities. The file allows for inference to the entire U.S. prison population. The respondent ID on this file is unique and the file does not allow for state or federal prisoners to be distinguished. The file requires the use of replicate weights for estimating standard errors and has the maximum required number of variables suppressed.

File Dimensions:

- No. of Cases: 24,848
- No. of Variables: 2,104
- Record Length: 9,674
- Records per Case: 1
- Overall No. of Records: 24,848

Type of File: ASCII data file

Data Format: Logical record length

Place of File Production: Ann Arbor, MI: Inter-university Consortium for Political and Social Research

Extent of Processing Checks: The data collection was processed according to the standard ICPSR processing procedures. The data were checked for illegal or inconsistent code values which, when found, were recoded to missing data values.

Notes

The record layout and variable description are the same for both the U.S. and state data files.

Prior to delivery of the 2016 SPI data to NACJD, BJS conducted a disclosure risk analysis. Based on the results of the analysis, a total of 89 variables are suppressed from the 2016 SPI data file to minimize the risk of disclosure and protect respondent privacy and confidentiality. These suppressed variables include a non-anonymized respondent ID, prisoner date of birth, dates generated by the CAPI instrument (i.e., SPI interview date, arrest date, and prison admission date), day value of self-reported prisoner admission date, literal responses to offense questions, city and zip code of prisoner's arrest, country of citizenship of prisoner, an open-ended variable of pre-incarceration income (due to extreme outliers), and two facility sampling variables. These variables include "Suppressed" in the variable label and are coded "999 = Variable Suppressed" on the data file.

Some of these variables exist in other forms on the data file. For example, the literal responses from prisoners to questions about specific offenses were used to assign a specific, standardized offense code per response, using BJS's standard offense codes that appear in Appendix A (see Offense CAPI Variables for more information). Other information was consolidated into summary analysis variables that appear on the data file as recoded variables, such as prisoner age at the time of the SPI interview and U.S. citizenship (see Recoded Variables for more information). The data file includes the year values of important dates. BJS expects to add more recoded variables to the data file to enhance the analytic capabilities of users due to variable suppression during 2021.

To protect respondent privacy, certain identifying information is restricted from general dissemination. The restricted variables and their labels are below. These variables also include "Suppressed" in the variable label and are coded "999 = Variable Suppressed" on the data file.

Public-use U.S. Data (state and federal combined)

Variable Description

Summary statistics (minimum, maximum, mean, median, and standard deviation) may not be available for every variable in the codebook. Conversely, a listing of frequencies in table format may not be present for every variable in the codebook either. However, all variables in the dataset are present and display sufficient information about each variable. These decisions are made intentionally and are at the discretion of the archive producing this codebook.

INMATE_TYPE (explained)

THE FOLLOWING ITEMS FEED INTO THE MOST SERIOUS OFFENSE, WHICH IS USED AS THE CONTROLLING OFFENSE IN LIEU OF ESTABLISHING THE CONTROLLING OFFENSE USING LONGEST SENTENCE LENGTH FOR CASES WHERE THE INMATE IS AWAITING TRIAL, SENTENCING, OR THERE FOR SOME REASON OTHER THAN SENTENCED: CJ14 AND CJ8. THERE ARE 2 TYPES OF INMATES WHO WILL HAVE A MOST SERIOUS OFFENSE. THE MOST SERIOUS OFFENSE WILL BE DETERMINED BY THE (PRESENCE OF) OFFENSES COLLECTED AT THE VARIOUS LOCATIONS DESCRIBED BELOW.

- 1 INMATE AWAITING TRIAL OR WAITING TO BE SENTENCED (AND NOT ON PAROLE, PROBATION, OR ESCAPE AT THE TIME OF THEIR ARREST/CJ7 = 4) – USE OFFENSES FROM CJ14 (OR ANSWER TO CJ14TYPE)
- 2 INMATE NOT SENTENCED, NOT CONVICTED/AWAITING SENTENCING, NOT AWAITING TRIAL AND BEING HELD FOR OTHER AUTHORITIES, A CIVIL COMMITMENT, SAFEKEEPING, OR ANOTHER REASON – USE OFFENSES FROM CJ8

THE FOLLOWING ITEMS FEED INTO THE CONTROLLING OFFENSE: CJ11, CJ19, CJ26, CJA1, CJA4, CJB3, AND CJB6. (THESE ARE ALL INMATES WHO HAVE BEEN SENTENCED AND THE LONGEST SENTENCE LENGTH IS USED TO ESTABLISH THE CONTROLLING OFFENSE.) THERE ARE 10 TYPES OF INMATES WHO WILL HAVE A CONTROLLING OFFENSE. THE CONTROLLING OFFENSE WILL BE DETERMINED BY THE (PRESENCE OF) OFFENSES COLLECTED IN THE VARIOUS LOCATIONS DESCRIBED BELOW.

- 3 INMATE NOT INCARCERATED FOR A PAROLE OR PROBATION VIOLATION AND NOT ON PAROLE OR PROBATION AT TIME OF ARREST (NEW COURT COMMITMENT) – USE OFFENSES FROM CJ11 (OR ANSWER TO CJ11TYPE)
- 4 ON ESCAPE WITH NO NEW OFFENSES – USE OFFENSES FROM CJ26 (OR ANSWER TO CJ26TYPE)
- 5 ON ESCAPE WITH NEW [SENTENCED] OFFENSES – USE OFFENSES FROM CJ19 (OR ANSWER TO CJ19TYPE)
- 6 ON ESCAPE WITH NEW [ARREST] OFFENSES – USE OFFENSES FROM CJ26 (OR ANSWER TO CJ26TYPE) *(ALTHOUGH NEW ARREST OFFENSES ARE COLLECTED AT CJ23)*
- 7 PAROLE VIOLATOR WITH NO NEW OFFENSES – USE OFFENSES FROM CJA1 (OR ANSWER TO CJA1TYPE)
- 8 PAROLE VIOLATOR WITH NEW [SENTENCED] OFFENSES – USE OFFENSES FROM CJA4 (OR ANSWER TO CJA4TYPE)
- 9 PAROLE VIOLATOR WITH NEW [ARREST] OFFENSES – USE OFFENSES FROM CJA1 (OR ANSWER TO CJA1TYPE) *(ALTHOUGH NEW ARREST OFFENSES ARE COLLECTED AT CJA7)*
- 10 PROBATION VIOLATOR WITH NO NEW OFFENSES – USE OFFENSES FROM CJB3 (OR ANSWER TO CJB3TYPE)
- 11 PROBATION VIOLATOR WITH NEW [SENTENCED] OFFENSES – USE OFFENSES FROM CJB6 (OR ANSWER TO CJB6TYPE)
- 12 PROBATION VIOLATOR WITH NEW [ARREST] OFFENSES – USE OFFENSES FROM CJB3 (OR ANSWER TO CJB3TYPE) *(ALTHOUGH NEW ARREST OFFENSES ARE COLLECTED AT CJB9)*

THERE IS ONE TYPE OF INMATE WHO WILL NOT HAVE A CONTROLLING OFFENSE OR MOST SERIOUS OFFENSE, AS A RESULT OF HAVING NO CRIMINAL JUSTICE STATUS WHEN THEY WERE ARRESTED OR CHARGED WITH THE OFFENSES FOR WHICH THEY ARE NOW SERVING TIME, (NOT ON PAROLE, PROBATION, OR ESCAPE) AND NOT OFFERING AN OFFENSE OTHER THAN “PAROLE VIOLATION” OR “PROBATION VIOLATION” WHERE OFFENSES ARE COLLECTED AT CJ11TYPE OR CJ14TYPE. SINCE PAROLE VIOLATION AND PROBATION VIOLATION IN AND OF THEMSELVES DO NOT HAVE ATTRIBUTES NEEDED TO DETERMINE A

CONTROLLING OFFENSE, THESE INMATES WILL NOT HAVE A CONTROLLING OFFENSE AND WILL RATHER HAVE THE WORD “OFFENSE” FILL IN DOWNSTREAM QUESTIONS. SUCH CASES WILL NOT GO TO THE INCIDENT CHARACTERISTICS SECTIONS OF THE INSTRUMENT, WHICH RELY ON THE CONTROLLING OFFENSE BEING EITHER A VIOLENT, PROPERTY, OR DRUG OFFENSE.

- 13 INMATE WITH NO OFFENSES RECORDED IN ANY OF THE APPLICABLE SECTIONS WHERE OFFENSES ARE COLLECTED (THE WORD, “OFFENSE” WILL FILL IN DOWNSTREAM QUESTIONS WHERE CONTROLLING_OFFENSE FILLS IN QUESTION TEXT)

ESTABLISH CONTROLLING OFFENSE FOR ALL INMATES

- SENTENCED INMATES:
 - WITH ONE OFFENSE THEN THAT OFFENSE IS THE CONTROLLING OFFENSE
 - WITH MULTIPLE OFFENSES AND SENTENCES, THE CONTROLLING OFFENSE IS THE OFFENSE WITH THE LONGEST SENTENCE
 - WITH MULTIPLE OFFENSES AND ONE SENTENCE, THE CONTROLLING OFFENSE IS THE “MOST SERIOUS” OFFENSE WHICH IS DETERMINED USING THE LOOK-UP TABLES AND A HIERARCHY, WHERE VIOLENT IS MOST SERIOUS, THEN PROPERTY, THEN DRUG
- UNSENTENCED PRISONERS:
 - WITH ONE OFFENSE THEN THAT OFFENSE IS THE CONTROLLING OFFENSE (FOR THOSE AWAITING SENTENCING THE OFFENSES THEY WERE CONVICTED OF/AWAITING SENTENCING FOR ARE USED; FOR ALL OTHER INMATES INCLUDING THOSE AWAITING TRIAL THE ARREST OFFENSES ARE USED)
 - WITH MULTIPLE OFFENSES, THE “MOST SERIOUS” OFFENSE IS THE CONTROLLING OFFENSE AND IS DETERMINED USING THE LOOK-UP TABLES (FOR THOSE AWAITING SENTENCING THE OFFENSES THEY WERE CONVICTED OF/AWAITING SENTENCING FOR ARE USED; FOR ALL OTHER INMATES INCLUDING THOSE AWAITING TRIAL THE ARREST OFFENSES ARE USED)

IF THE LOOKUP TABLE DOES NOT ENABLE THE FI TO LINK TO AN OFFENSE IN OUR DATABASE, THE FI WILL ASK CJ33 FOR EACH OFFENSE. ONCE IT IS DETERMINED WHICH OFFENSE HAS THE LONGEST SENTENCE *AND* IT IS KNOWN WHICH CATEGORY EACH OFFENSE FALLS INTO (VIOLENT, PROPERTY, DRUG, OR OTHER), THEN WE KNOW WHICH INCIDENT CHARACTERISTICS SECTION OF THIS MODULE (VIOLENT, PROPERTY DRUG, OR NONE AND SKIP TO CJ36) THE INMATE SHOULD RECEIVE.

EACH OFFENSE IN THE LOOKUP TABLE HAS A TYPE (VIOLENT, PROPERTY, DRUG, PUBLIC ORDER, OR OTHER) ASSOCIATED WITH IT, WHICH INFORMS THE CONTROLLING TYPE. IN THE EVENT THAT THE OFFENSE PROVIDED BY THE INMATE IS NOT FOUND IN THE LOOKUP TABLE, THE CONTRLLING TYPE IS SET BASED ON THE INMATE’S RESPONSE TO CJ33, WHICH DIRECTLY ASKS WHAT TYPE OF OFFENSE IT IS CONSIDERED TO BE.

⁵ Programming error: SESA2 should have been asked when the highest grade the inmate attended was 12th (SES3=12) and they did not confirm completion of that year (SESA1=2, DK, or REF), the highest grade attended was 1st-11th (SES3=1-11), or they did not report a highest grade completed (SES3=DK or REF). However, it was originally programmed such that if SES3 was answered as DK or REF (they did not report a highest grade attended), or SES3 was answered 1-11 and SESA1 was not 1 (highest grade attended was 1-11, but did not confirm completion), or SES3 was answered 12 and SESA1 was not 2 (highest grade attended was 12, but did not confirm non-completion), the questionnaire inappropriately skipped SESA2 (GED). As a result of the error, 7,879 inmates were inappropriately skipped past SESA2 before the error was corrected (on 9/29/2016). After the programming patch, 590 cases were correctly routed.

⁶ Programming error: SESA4 should have been asked of all inmates who received a GED (SESA2=1 or SESA3=1) but it was only asked of inmates when SESA3=1. As a result, before the errors were corrected (on 9/29/2016), the 7,879 cases that were inappropriately skipped past SESA2 were also skipped past SESA4. In addition, 3,062 fewer inmates were asked SESA4 than should have been as they answered SESA2=1, bringing the total to 10,941 cases incorrectly routed past SESA4. After the programming patch, 549 cases were correctly routed.

TIME OF OFFENSE

¹⁹ Specification error: Presentation of DU6c should have been based on a “Yes” to both DU1c (lifetime use of crack cocaine) and DU6b (cocaine use in the 30 days before arrest). As specified, 172 inmates were able to report no use of “any form of cocaine” (DU6b) but use of “crack” (DU6c) in the 30 days before arrest. To correct for this, it is possible to recode DU6c to 2 (“No”) for these 172 cases.

²⁰ Programming error: The specification for DU8c should have led to the question being asked when DU1c (lifetime use of crack cocaine) and DU7 (being under the influence at the time of offence) were both “Yes.” The error resulted in DU8c being asked when DU1c (lifetime use of crack) and DU1e (lifetime use of PCP) and DU7 (being under the influence at the time of offense) were all “Yes.” As programmed, 2,919 fewer cases were asked DU8c than should have been. However, among the 2,919 cases, there were 1,895 cases where DU8b=2 (“No” cocaine use at time of offense); these cases would not have been presented with DU8c had the questionnaire included a logical routing past the item when DU8b=2 (“No”). To correct for this, it is possible to recode DU8c to 2 (“No”) for these 1,895 cases. There were an additional 241 cases where DU8c was missing for some reason unrelated to the programming error. Taken together, there were 1,265 cases missing a response to DU8c (i.e., 2,919-1,895+241). Of the 1,265 cases, 1,024 cases were missing DU8c due to the programming error.

²¹ Specification error: Presentation of DU8c should have been based on a “Yes” to both DU1c (lifetime use of crack cocaine) and DU8b (cocaine use at time of offense). As specified, 44 inmates were able to report no use of “any form of cocaine” (DU8b) but use of “crack” (DU8c) at the time of offense. To correct for this, it is possible to recode DU8c to 2 (“No”) for these 44 cases.

²⁴ Specification error: Items from the DTX5 series (treatment received since admission) were only asked when the corresponding items in the DTX4 series (treatment received in lifetime) were answered “Yes.” It can be assumed that if there was not lifetime treatment, then there would be no treatment since admission. Since the DTX5 series was skipped as described, the survey data are missing for the DTX5 variables. To correct for this, it is possible to recode DTX5 variables to 2 (“No”) if the corresponding DTX4 variable is 2 (“No”).
